

Week 9: Hierarchical GLM

20/03/23

Lip cancer

Here is the lip cancer data given to you in terribly unreproducible and error-prone format.

- `aff.i` is proportion of male population working outside in each region
- `observe.i` is observed deaths in each region
- `expect.i` is expected deaths, based on region-specific age distribution and national-level age-specific mortality rates.

```
observe.i <- c(
  5,13,18,5,10,18,29,10,15,22,4,11,10,22,13,14,17,21,25,6,11,21,13,5,19,18,14,17,3,10,

Question 1

Explain a bit more what the `expect.i` variable is. For example, if a particular area has an expected deaths of 6, what does this mean?

Answer

Expected deaths is the implied number of lip cancer deaths for a particular region given that region's age structure and the national level age-specific mortality rates for lip cancer. For example, an expected number of deaths of 6 would mean that particular region, we would expected 6 lip cancer deaths if this region were to experience the same age specific mortality rates as at the national level.

Question 2

Run three different models in Stan with three different set-up's for estimating θ_i , that is the relative risk of lip cancer in each region:

1. Intercept α_i is same in each region $= \alpha$
2. α_i is different in each region and modeled separately (with covariate)

3. α_i is different in each region and the intercept is modeled hierarchically (with covariate)

Answer

$$y_i | \theta_i \sim \text{Poisson}(\theta_i \cdot e_i)$$

model 1:

$$\log \theta_i = \alpha + \beta x_i$$

model 2

$$\log \theta_i = \alpha_i + \beta x_i$$

model 3:

$$\log \theta_i = \alpha_i + \beta x_i$$

with

$$\alpha_i + \beta x_i$$

model 1

```
library(tidyverse)
library(rstan)
library(tidybayes)
```

```
stan_data <- list(y = observe.i,
                  log_e = log(expect.i),
                  N = length(observe.i),
                  x = aff.i - mean(aff.i))
```

```
mod1 <- stan(data = stan_data, file = "../code/lab9_1.stan")
```

Chain 4: Iteration: 1600 / 2000 [80%] (Sampling)

Chain 4: Iteration: 1800 / 2000 [90%] (Sampling)

Chain 4: Iteration: 2000 / 2000 [100%] (Sampling)

Chain 4:

Chain 4: Elapsed Time: 0.241 seconds (Warm-up)

Chain 4: 0.215 seconds (Sampling)

Chain 4: 0.456 seconds (Total)

Chain 4:

Question 3

Make two plots (appropriately labeled and described) that illustrate the differences in estimated θ_i 's across regions and the differences in θ s across models.

```
res_mod1<-mod1 |>
  gather_draws(log_theta[i])|>
  median_qi()|>
  rename(median_mod1 = .value,
         lower_mod1 = .lower,
         upper_mod1 =.upper)|>
  select(i,median_mod1:upper_mod1)
res_mod2<-mod2 |>
  gather_draws(log_theta[i])|>
  median_qi()|>
  rename(median_mod2 = .value,
         lower_mod2 = .lower,
         upper_mod2 =.upper)|>
  select(i,median_mod2:upper_mod2)
res_mod3 <-mod3 |>
  gather_draws(log_theta[i])|>
  median_qi()|>
  rename(median_mod3 = .value,
         lower_mod3 = .lower,
         upper_mod3 =.upper)|>
  select(i,median_mod3:upper_mod3)
res <- res_mod1|>
  left_join(res_mod2)|>
  left_join(res_mod3)

res |>
  select(median_mod1,
         median_mod2,
         median_mod3)|>
  pivot_longer(median_mod1:median_mod3,names_to = "model",values_to = "log_theta")|>
  mutate(model = str_remove(model, "median_")) |>
  ggplot(aes(log_theta, fill = model)) +
  geom_histogram(position = 'dodge')
```

```
res |>
  mutate(deaths = observe.i) |>
  mutate(log_smr = log(observe.i/expect.i)) |>
  ggplot(aes(log_smr, median_mod1, color = "Model 1"))+
  geom_point(aes(size = deaths), alpha = 0.6) +
  geom_errorbar(aes(ymin = lower_mod1, ymax = upper_mod1, color = "Model 1"), alpha = 0.6)
  geom_abline(slope = 1, intercept = 0)+
  geom_point(aes(log_smr, median_mod2, color = "Model 2"), alpha = 0.6) +
  geom_errorbar(aes(ymin = lower_mod2, ymax = upper_mod2, color = "Model 2"), alpha = 0.6)
  geom_point(aes(log_smr, median_mod3, color = "Model 3"), alpha = 0.6) +
  geom_errorbar(aes(ymin = lower_mod3, ymax = upper_mod3, color = "Model 3"), alpha = 0.6)
```

The level of uncertainty in Model 1 is lower, but it tends to be more focused on specific points. Model 2 has more uncertainty compared to model 3.
